

A privacy-enhancing, rights preserving digital wallet

DECODE lets people decide what data they want to keep private, what data they want to share, with whom, and on what terms.

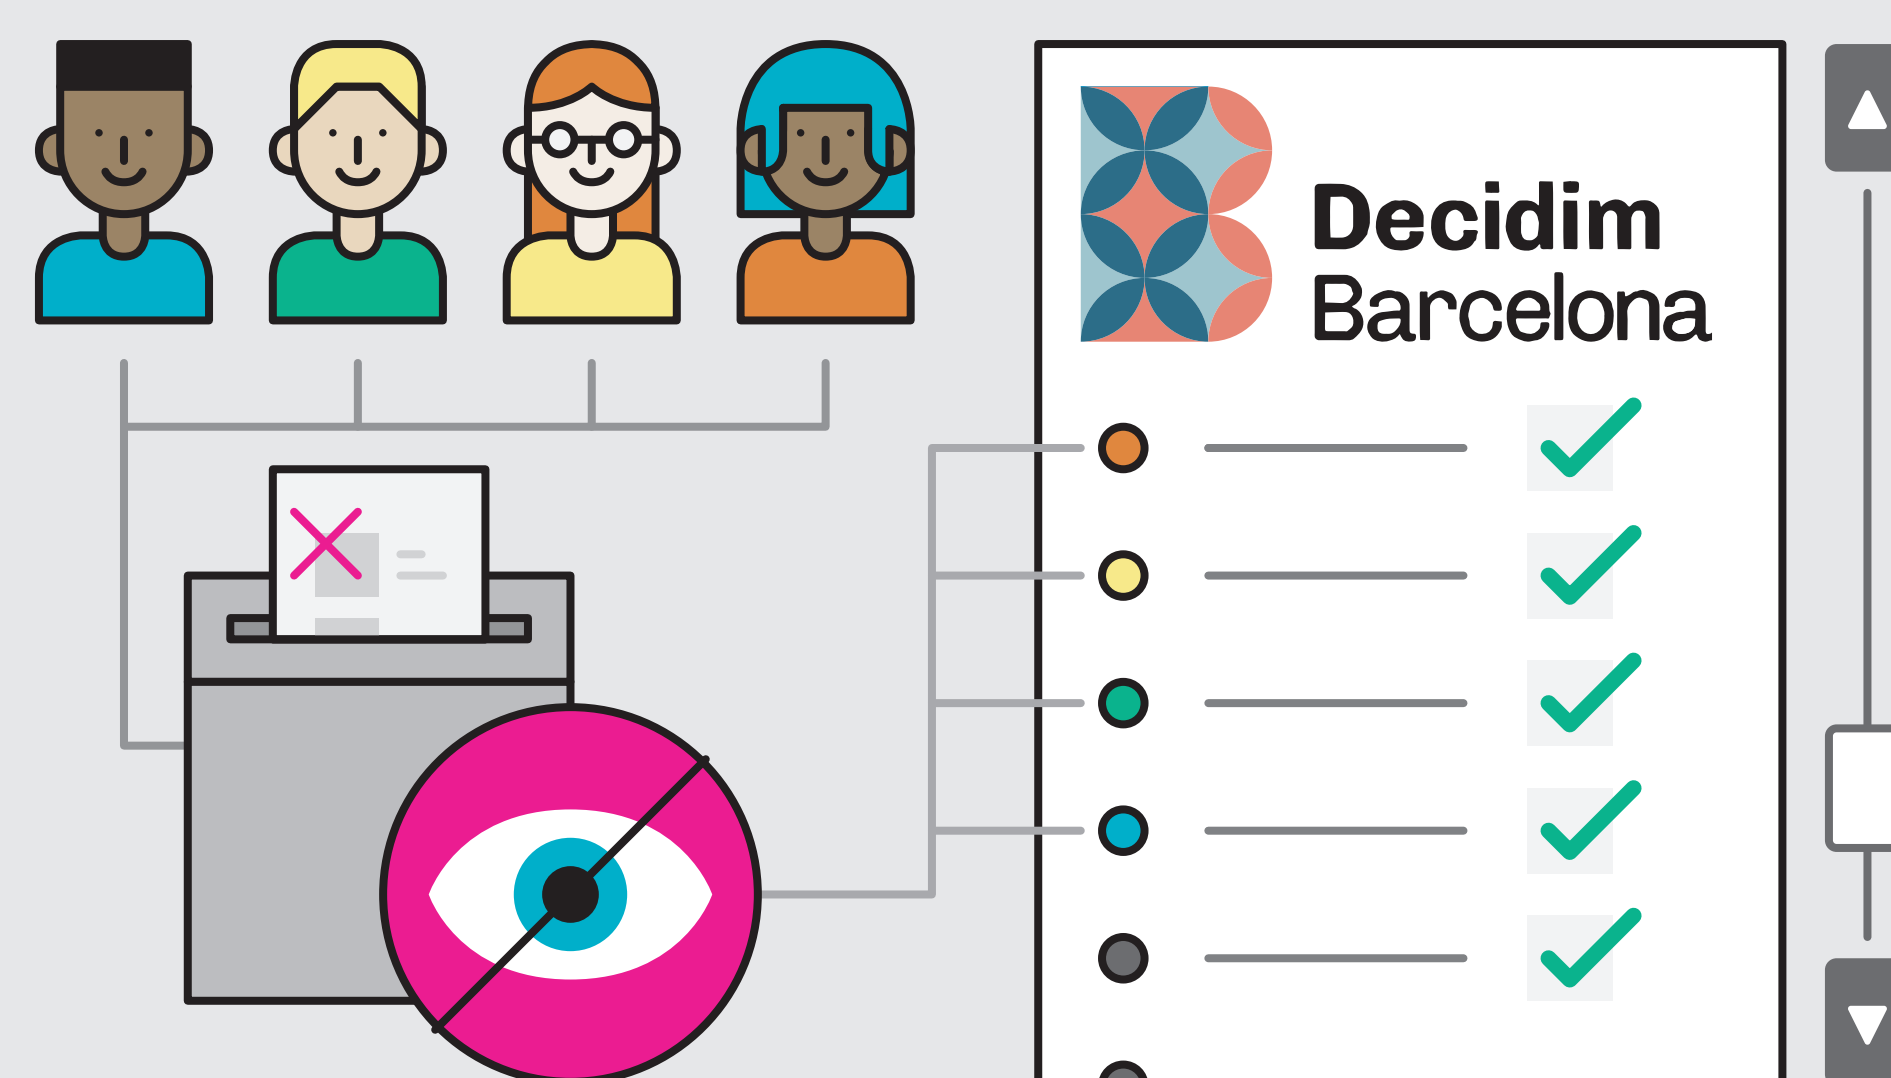

Decentralised, open source architecture

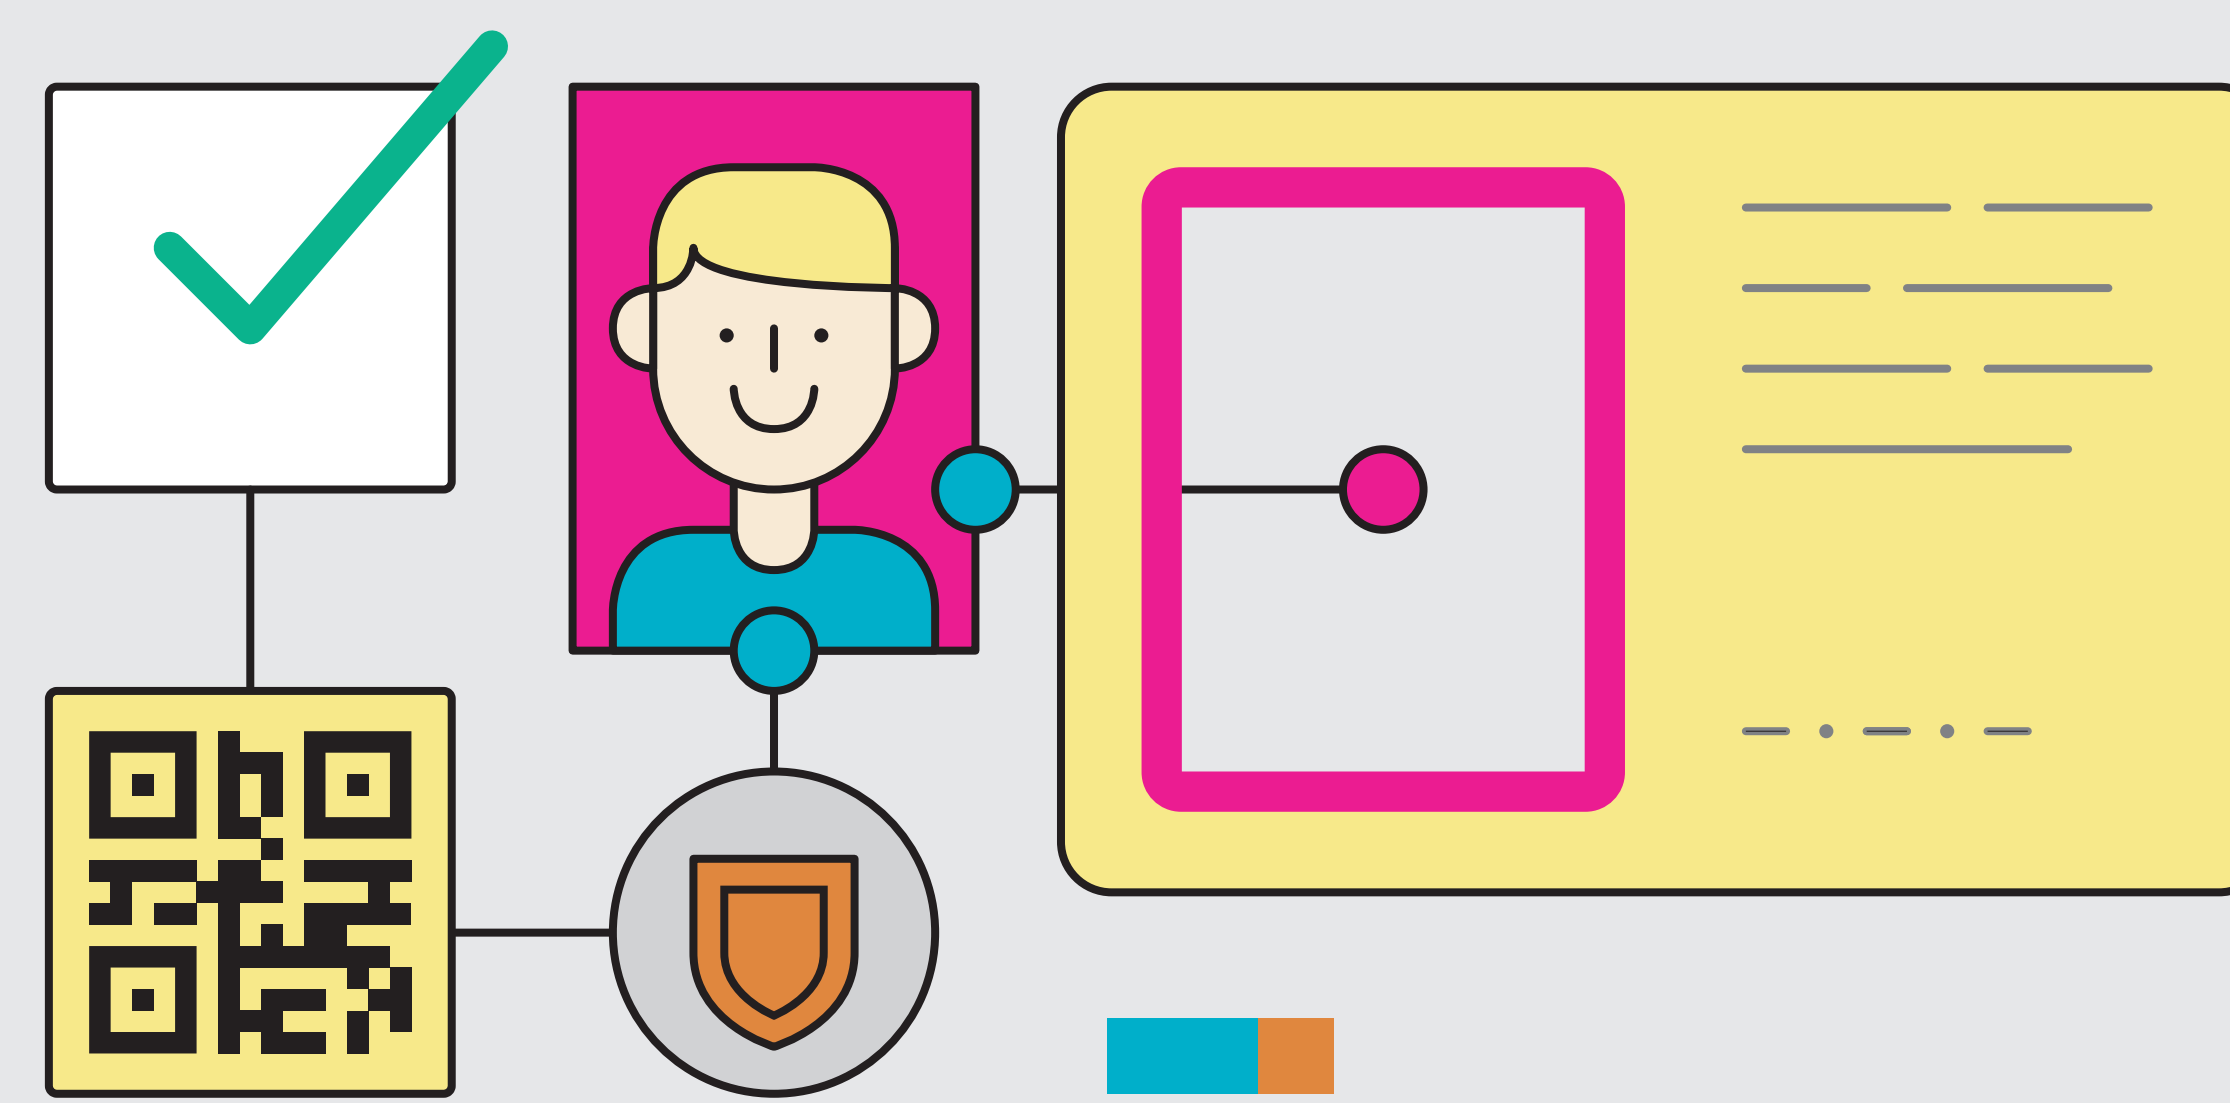

Testing the technology with real people

DECODE is working with Barcelona and Amsterdam City Councils to build prototype applications and test them in partnership with real communities. The pilots include:

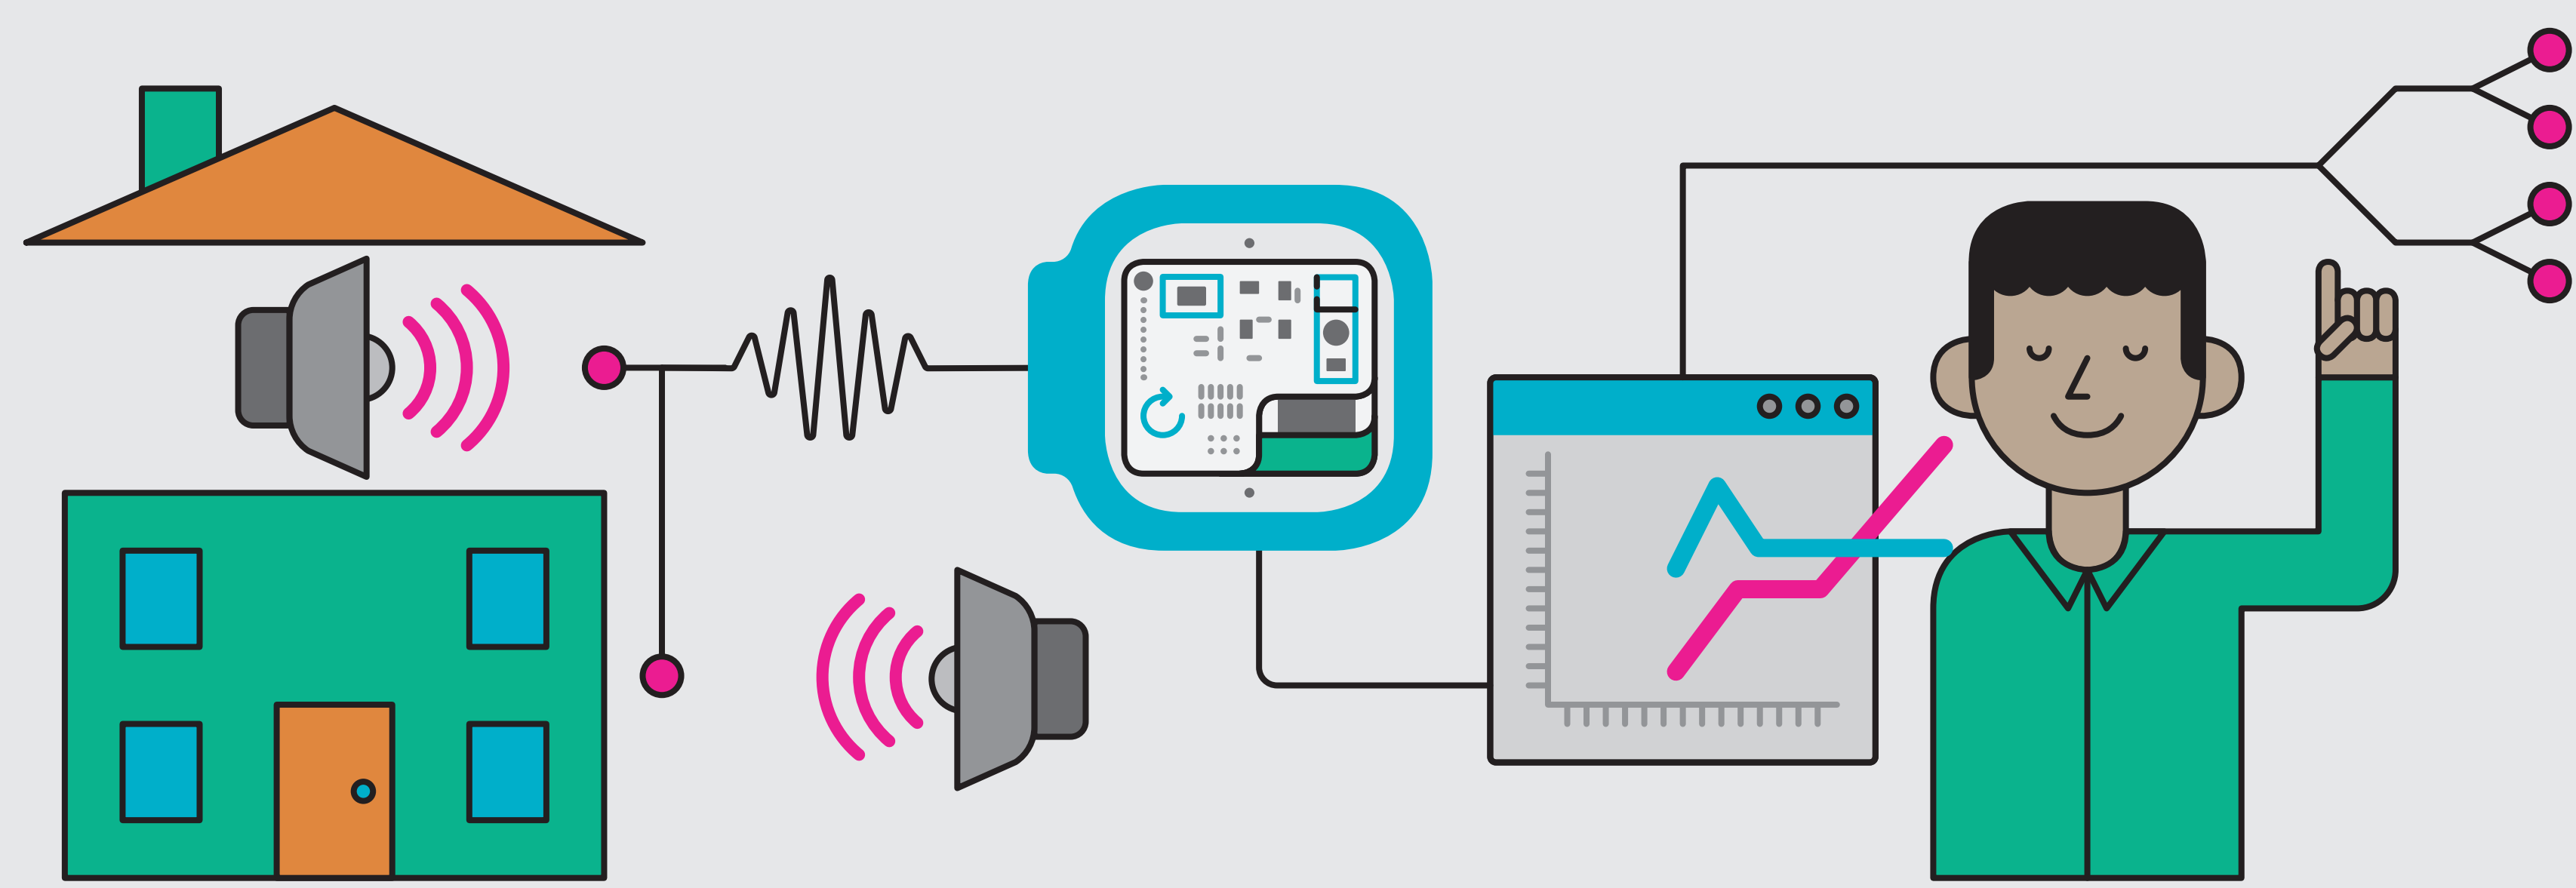

Privacy-enhanced petition signing

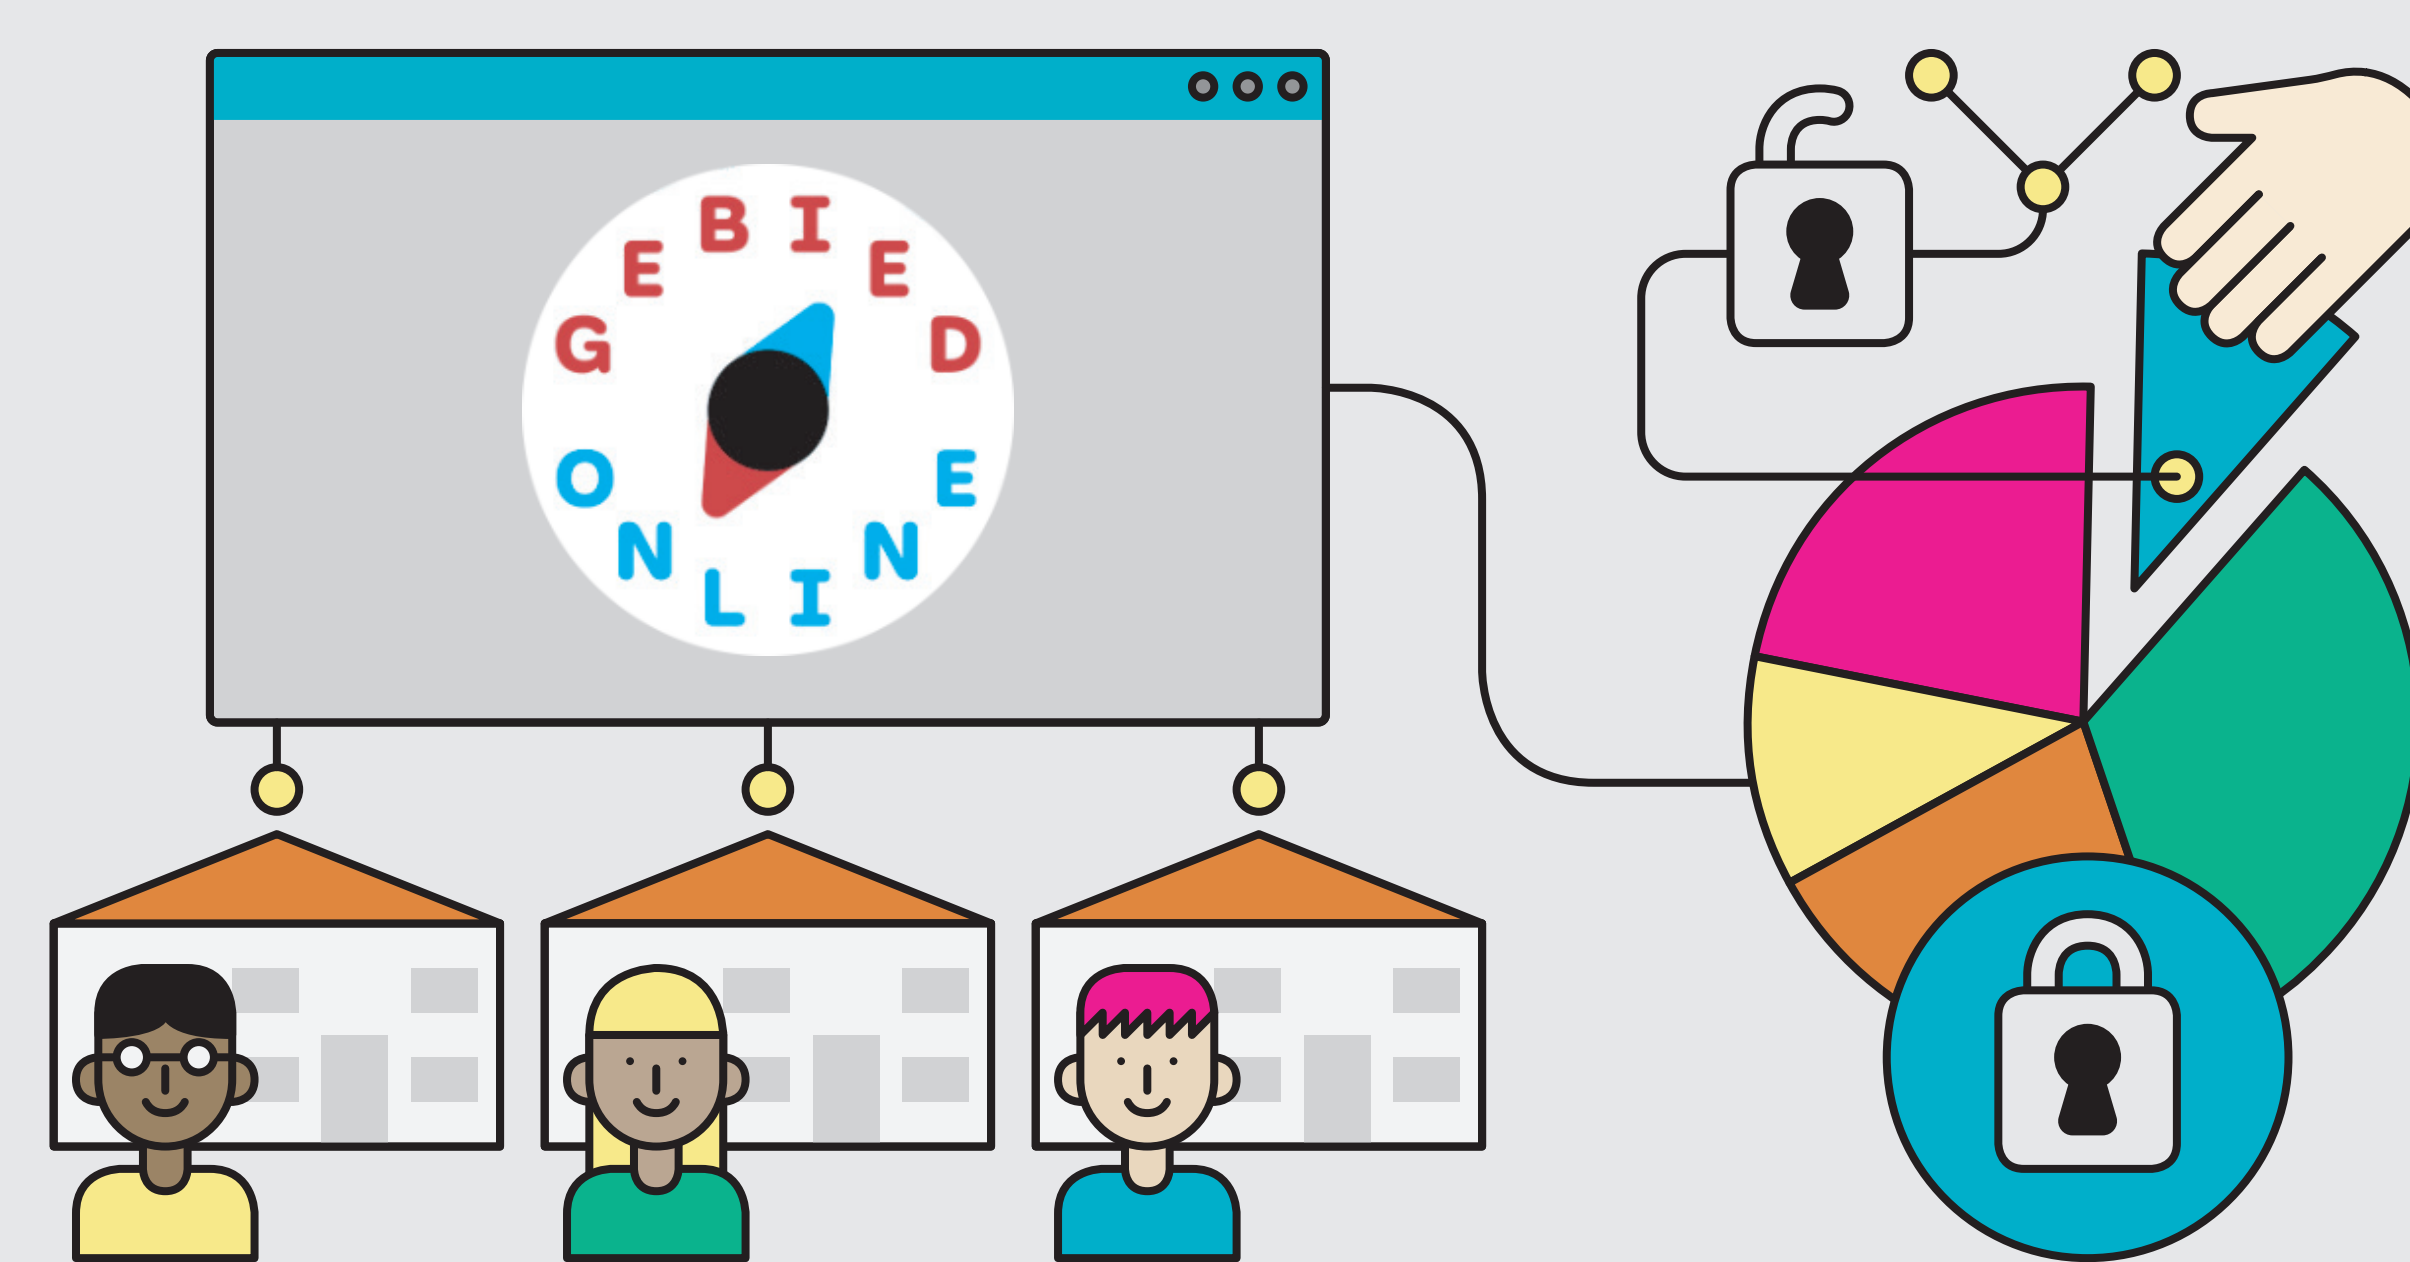

Anonymous proof of attributes

Collecting and sharing citizen sensed data

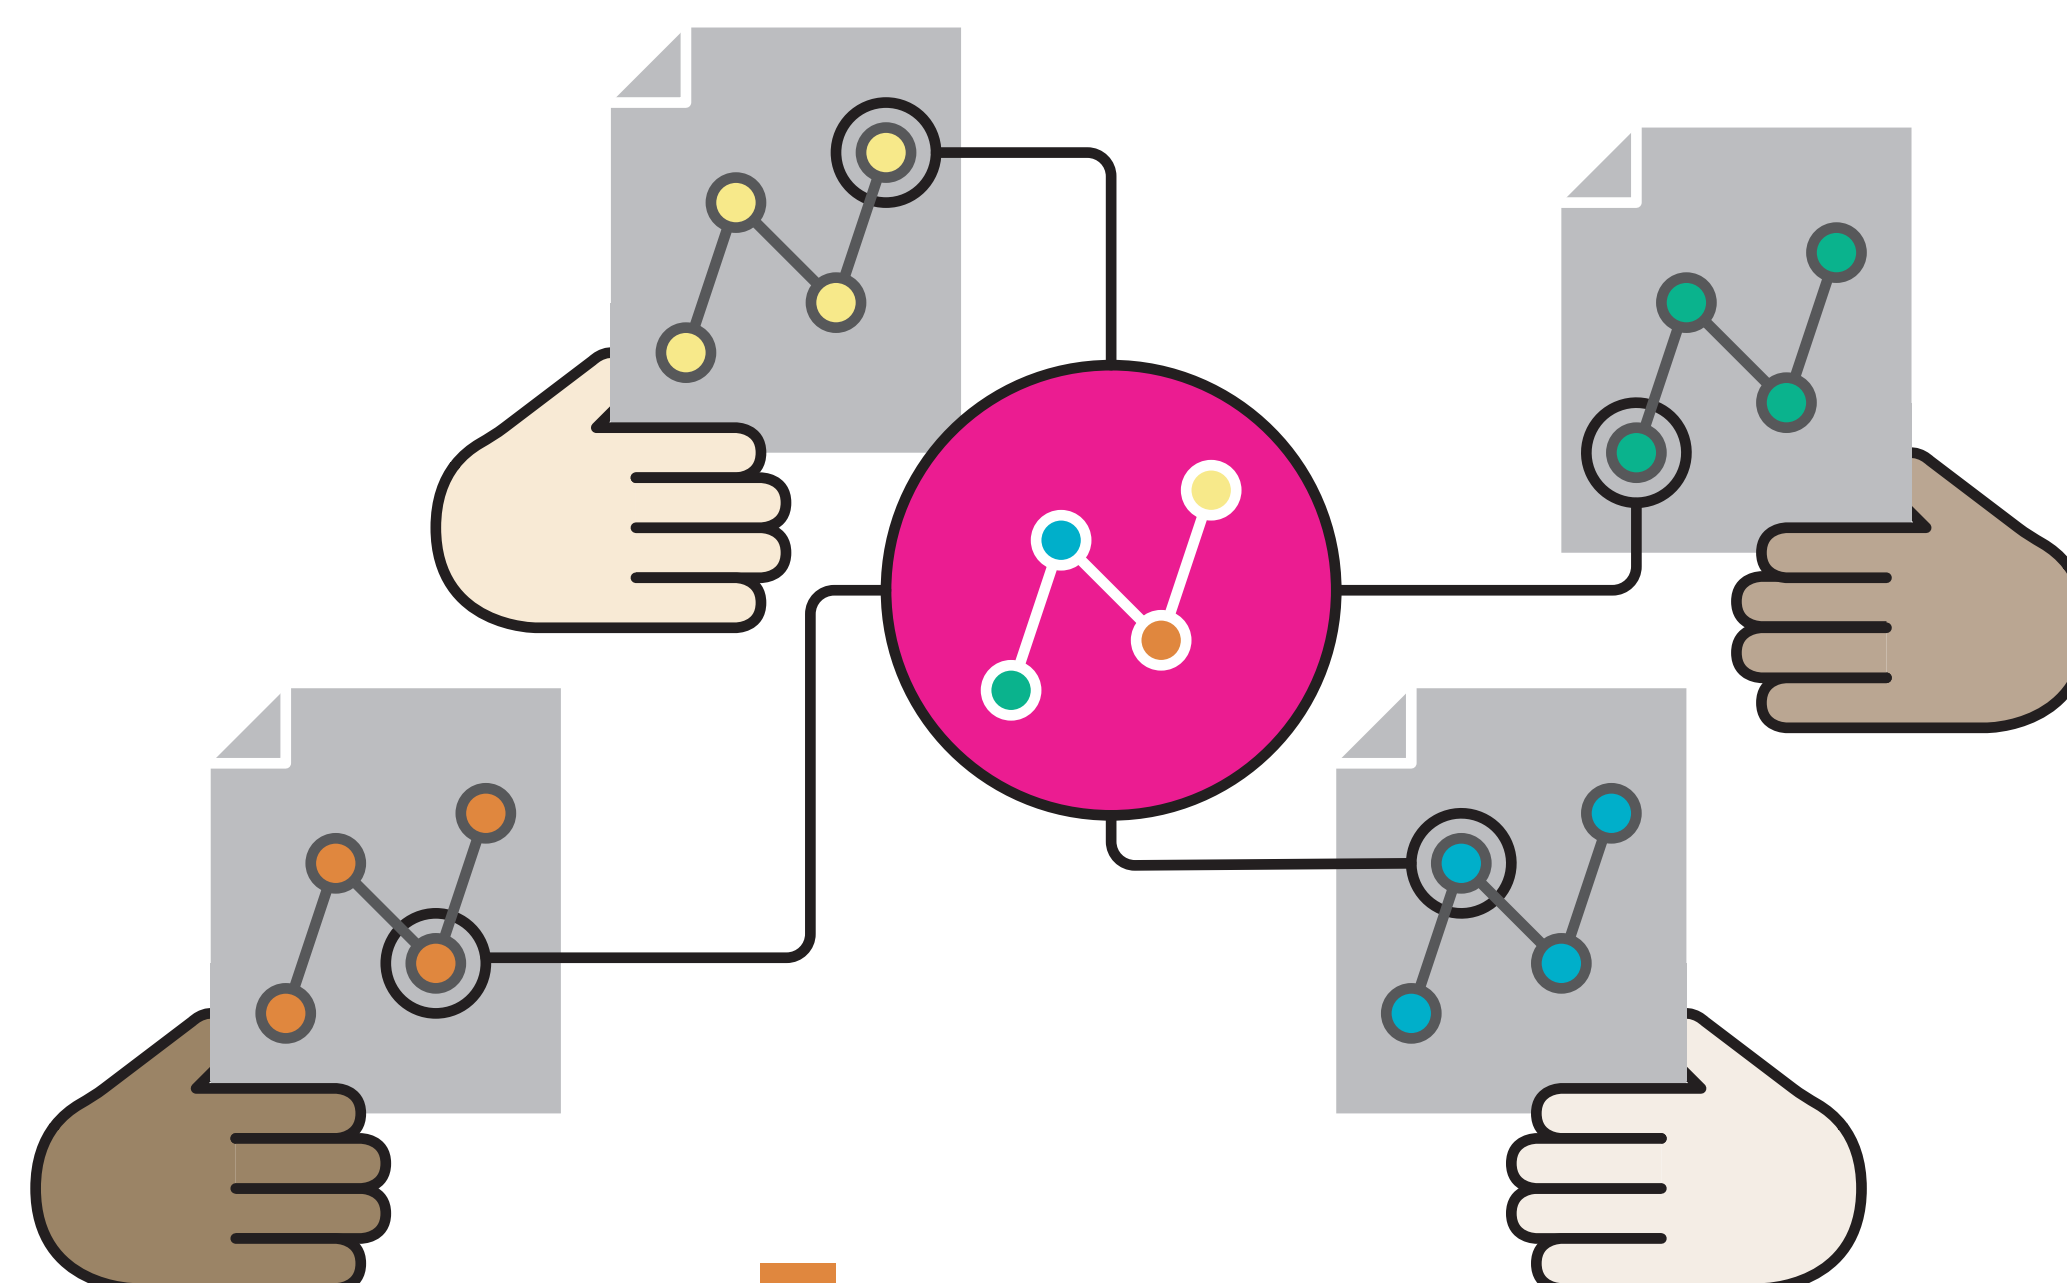

An ethical, locally owned social network

Our vision of new 'commons' for data

DECODE aims to enable a new generation of peer-to-peer digital applications, where communities can leverage the collective value of their data
